Programming Assignment

In this lesson I practiced using enum. I really enjoyed doing it. I didn't have a lot of problems, just a few small ones. I programmed them. I attached the screenshots.

This is what I did in my code:

Here I create a fixed list of emergency codes for hospitals

All the codes with their meaning with brake and case

I save the meanings of the code

Then I will give them an automatic value

Then I create it so that I can get it back

for (Hospital.values()): automatically goes through all the codes

Then I catch everything

desp(code): runs the instructions function for each code

My code:

```
package m5;
//Here I create a fixed list of emergency codes for hospitals
enum Hospital {
//All the codes with their meaning
    Code_Red("Fire"),
    Code_Blue("Cardiac Arrest "),
    Code_Yellow("Bomb Threat "),
```

```

Code_Orange("Hazardous Material Spill "),
Code_Green("Evacuation."),
Code_Clear("Situation has been resolved ");
//I save the meanings of the code
private final String descripcoin;
// constructor for each one above
//Then I will give them an automatic value
Hospital(String descripcoin) { //I save the meanings of the code
this.descripcoin = descripcoin;
}
// the method to read it Then I create it so that I can get it back
public String getDescripcoin() {
return descripcoin;
}
}
public class m5 {
public static void desp(Hospital code) {
switch(code){
//Your program must include a function to display the instructions for each code. For example:
//All the codes with their meaning with brake and case
case Code_Red:
System.out.println("Call Fire Department and activate code Green ");
break;

case Code_Blue:
System.out.println("Call cardiologist in charge");
break;

case Code_Yellow:
System.out.println("Call 911 and activate code Green");
break;

case Code_Orange:
System.out.println("Call Health and Safety ");
break;

case Code_Green:
System.out.println("push the emergency button or alert hospital workers.");
break;

case Code_Clear:
System.out.println("deactivate all code.");
break;
}
}
public static void main(String[] args) {

```

```

//for (Hospital.values()): automatically goes through all the codes
for (Hospital code :Hospital.values()){
System.out.println("code "+code);
System.out.println(code.getDescripcoin());
desp(code);// runs the instructions function for each code
}
}

}

```

Output:

```

code Code_Red
Fire
Call Fire Department and activate code Green
code Code_Blue
Cardiac Arrest
Call cardiologist in charge
code Code_Yellow
Bomb Threat
Call 911 and activate code Green
code Code_Orange
Hazardous Material Spill
Call Health and Safety
code Code_Green
Evacuation.
push the emergency button or alert hospital workers.
code Code_Clear
Situation has been resolved
deactivate all code.

```
